

Part 1.2 — Feature one-pager: Bill Banayein

One AI-powered feature for Part 1 retention.

Not the default app flow — one entry among browse / cart / order; retention wedge for new jobs.

Which reason this attacks

Rank	Reason	Role
#1	Next material run goes to hardware dealer (WhatsApp / credit / spec)	Biggest structural bet — intercept at client hisaab before dealer gets full list
#2	14-day metric mixes new-site jobs vs platform churn	New job → new bill each time; measure bills/week + Fixxly lines per bill
#3	App = passive SKU catalog , no business workflow	Primary product attack — bill creation, not browse
#4	Next basket not on Fixxly / silent search exit	Honest split + reference master prices for full job

#5 (trust, cohort noise) = OTIF on Fixxly orders + segmented metrics.

Problem (one paragraph)

Week-1 contractors **do** need materials again — usually on a **new job**, client often **pays for materials**, and the **hardware dealer** gets one WhatsApp: *full list + price + udhaar*. Fixxly wins the **first urgent order**; it loses **order 2+** because the app is only a shop, not where the contractor **builds the client bill**. **Bill Banayein** makes Fixxly the place every job starts: **full material estimate → markup → share with client (contractor brand only) → order Fixxly lines → WhatsApp dealer the rest**.

One-liner

Contractor creates a client material bill in 3 minutes — voice or template — sees Fixxly vs dealer split, adds markup, shares PDF. Customer never sees Fixxly.

Persona & UX principles

Constraint	Design response
10th / 12th pass , not tech-savvy	One step per screen; big tiles; photos > text; max 2 actions per screen
On-site, 7:45am , dusty hands	Voice-first option; live bill while speaking; thumb-sized CTAs
Multilingual (Bangalore)	Contractor UI: Kannada + English (toggle); voice STT in both; client PDF matches contractor choice
Low trust in apps	Sample voice demo before first record; live bill builds while they speak (instant feedback)
Makes money on markup	Markup required at launch — client never sees Fixxly cost or reference cost

Customer rule: End client sees **only contractor name / phone / logo** on PDF — **never Fixxly**.

End-to-end flow (v1)

```
Login → Home (browse / cart / order remain default)
  → Bill Banayein [feature entry – not default path]

  → Select job type

  → Choose input mode:
    A) Prebuilt template (lines + qty pre-filled)
    B) Voice recording
      · Play sample recording (“aisa bolein”)
      · Record → LIVE bill updates on screen as AI parses
      · Contractor sees lines appear in real time → drives adoption

  → Edit bill: materials + qty (+ brand optional) + add lines later

  → Select site name

  → AI prices:
    · Fixxly lines → live store price + stock flag
    · Other lines → master reference price (multi-source crawl, cross-verified)
    · Unknown item → fetch online → append master → tag “estimate”
    · Brand given → that brand SKU; no brand → national default + “ya iss class ka”

  → Contractor review (cost vs sell – contractor only)

  → Split view:
    · Fixxly se – order now (30 min)
    · Dealer se – local hardware (no Fixxly stock)

  → Markup (% on total and/or per section; per-line override)

  → Preview client PDF (contractor letterhead only)

  → Share to client (WhatsApp / image / PDF)

  → [One-click Order Fixxly part]
  → [WhatsApp dealer list – SKUs + qty + site, NO prices]
```

What the AI does

Bill Banayein is not open-ended chat. AI orchestrates **bill assembly + pricing + split**:

Live voice bill: Partial transcripts update draft lines every ~2–3s so contractor **sees the app “listening”** before they finish.

Data architecture

Two catalogues

Catalogue	Contents	Pricing
Fixxly fulfilment	In-stock @ dark store	Live, exact
Reference master	Trade SKUs (incl. not stocked)	Multi-source estimate ; clearly tagged in UI

Reference price hierarchy (pilot — full crawl):

Manufacturer MRP → authorised e-commerce → competitor public listings ([HomeRun](#) etc.) → local store samples → median + outlier rejection → store in master with `source`, `updated_at`.

Unknown SKU at quote time: Web search → normalize → append master → show contractor **“Nayi line — confirm keemat”** before client share.

Assignment baseline: order history, SKU catalogue, contractor profile — **extended** with reference master, inventory, contractor branding (name, phone, logo).

Data	Use	Launch
Order history	Templates, frequent lines	Yes
Fixxly SKU + inventory	Split + order	Yes
Reference master	Full-job pricing	Yes — pilot crawl
Contractor profile	PDF letterhead, language, markup default	Yes
Site name list	Reuse prior sites	Nice-to-have

Model / approach — hybrid (and why)

Step	Approach	Why
Voice → lines	Streaming STT + constrained NLU	Live bill; Kannada + English + Hindi
Job → template	Rules	Auditable BOM seeds
Line → SKU	Retrieval (master + aliases)	No invented SKUs
Reference price	Crawl + median + rules	Cross-verify; tag as estimate
New SKU fetch	Search + extract + human confirm	Expand master; avoid silent wrong price
Fixxly split	Hard inventory rule	LLM cannot mark OOS as Fixxly
Client PDF copy	Templates (+ optional LLM for item labels)	Consistent, cheap
Markup	Rules + UI	Business-critical

Why not pure LLM: Hallucinated SKUs/prices → contractor loses face with client.

Why not pure rules: Voice and messy trade names need NLU + retrieval.

Client vs contractor vs dealer outputs

Audience	Sees	Does not see
Client	Contractor-branded PDF; item, qty, sell rate , total; optional labour line	Fixxly, cost prices, dealer list
Contractor	Full bill; cost vs sell; Fixxly / dealer tags; margin ₹	—
Dealer (WhatsApp)	Site, SKU spec, qty	Any prices (avoids leaking reference rates)

Accepted at launch: Dealer may receive full shopping list — tackle bundle / credit competition later.

Why this moves retention (not BAU reorder)

BAU "order again"	Bill Banayein
Same basket replay	New job → new bill every time
Competes with dealer on tap speed	Competes at client money conversation
Needs same site	Works new site daily
Consumer pattern	Contractor business tool + partial fulfilment

North star: Bills per contractor per week → Fixxly order rate per bill (in-stock lines).

Success at 30 days (pilot: 1 store)

Metric	Target
Bills created / active contractor / week	≥1.5 (vs holdout ~0.3 browse-only)
Bill → Fixxly order (any in-stock line)	≥45% within 7d
Bill → client share	≥50% of completed bills
Orders / contractor / week	+30% vs holdout
Voice path adoption (of bills)	≥25% after sample demo
Time to first shareable PDF	<5 min median
Pricing dispute / "galat hisaab"	<8% of shared bills

Segmented: D14 reorder for users who created ≥1 bill in days 1–14.

30-day rollout

Week	Ship
W1	3 job types; template path; split; markup; white-label PDF; Fixxly one-click order
W2	Voice + sample recording + live bill ; Kannada STT
W3	Master crawl + cross-verify; unknown-SKU fetch
W4	Metrics; dealer WhatsApp format polish

Risks & mitigations

Risk	Mitigation
Dealer gets full list (Risk 1)	Accepted launch; order Fixxly first in flow; revisit credit/bundle later
Wrong reference price	Estimate label; multi-source median; contractor confirm gate
Voice fails / noise on site	Template fallback always visible; edit every line
Customer sees Fixxly	White-label PDF only; QA checklist
Scope creep on crawl	Job-type scoped SKU universe first; expand weekly

Founder sentence

Bill Banayein puts Fixxly at the start of every job — full client hisaab, honest Fixxly vs dealer split, contractor keeps the margin — so order 2 is natural, not a forgotten reorder button.

Part 1.3 UX (3 screens)

Full wireframes, copy, and Figma checklist: `part-1-ux-sketch-3-screens.md`

Screen	Name	Purpose
1	Bol ke banao	Job type + voice/template + live bill strip while recording
2	Hisaab + split	Edit lines · Fixxly green / dealer grey · markup chips · margin ₹
3	Client ko bhejo	White-label PDF preview · WhatsApp share · Order Fixxly · Dealer list
