

Fixxly — Head of Product Assignment

Pankaj Khannade · May 2026

The one thing I would change about this assignment if I were setting it

At this stage, Fixxly does not yet have rich retention data — so I would ask candidates not only **what to build**, but **what three things they would track in the first month to know whether it is working**. Examples: where contractors buy materials after order 1 (dealer vs Fixxly), bill-to-order conversion for Bill Banayein, and daily unique orderers to ground MAC. The rest of the brief — one sharp bet, a working AI prototype, and a unit economics case — I would keep as-is.

Contents of this document

Section	Content
Part 1	Retention diagnosis · Bill Banayein feature · 3-screen UX · Appendix A (MAC / catchment)
Part 3	Unit economics table · assumptions · 60 → 150 OPD bridge · 3-sentence prioritization

Part 2 (AI Order Co-Pilot prototype): *[link to be added in submission email — Colab / GitHub / Replit]*

Fixxly — Part 1: Retention Diagnosis & Product Response

Pankaj Khannade · Head of Product Assignment
May 2026

Executive summary

The number: 40% of Week-1 contractors do not place a second order within 14 days.

Diagnosis: Fixxly wins the **urgent first order**; it loses **order 2 and beyond** because the **hardware dealer** still owns how contractors run the **next job** — especially the **client material quote** — and the current app is a **catalogue**, not a **business tool**.

Proposed response: Bill Banayein — the contractor voices or templates a full client bill in approximately 3 minutes, sees an honest **Fixxly vs dealer split**, adds markup, shares a **white-label PDF** (the client never sees Fixxly), then places **Order Fixxly lines** in one tap.

30-day success (1-store pilot): ≥ 1.5 bills/contractor/week · $\geq 45\%$ bills → Fixxly order · $\geq 50\%$ bills shared with client.

1. Operating context

TODAY	TARGET (90 days)
3 dark stores ~60 OPD / store App = browse → cart → order 60% Week-2 retention	Same footprint 150 OPD / store App + job-start workflow Move the addressable half

Assumption	Implication
Urban plumber / mistri, Bangalore	Voice + bilingual UI; not consumer e-commerce UX
Client often pays for materials	Contractor is procurement agent — quote matters
Many jobs = new site daily	"Reorder last basket" is the wrong hero feature
Fixxly wedge = 30 min , not SKU count	Honest partial fulfilment beats pretending full catalogue
30-min delivery radius ~10–15 km per dark store	Catchment holds ~2k–8k active material buyers/month; Fixxly touches ~200 at 60 OPD (see Appendix A and Part 3)

Appendix A — Scale at 60 OPD (operating context)

Full unit-economics build in Part 3. Summary here for retention framing.

Input	Assumption	Calculation
Delivery radius	10–15 km (~12 km mid)	30-min constraint in Bangalore traffic
Catchment area	$\pi \times 12^2 \approx \mathbf{450 \text{ km}^2}$	One store blob; 3 stores overlap
Active material buyers in catchment / month	~2,000–8,000	~15–25% of Bangalore trade SAM per store (market appendix)
Orders / store / month	$60 \times 30 = \mathbf{1,800}$	Assignment OPD
Daily unique orderers	$60 \div \mathbf{1.3} \approx \mathbf{46}$	~1.3 orders per contractor on active days
MAC / store / month	~200 (range 180–220)	46 daily $\times$ ~4.3 overlap factor $\approx$ 200 unique/month
Orders / MAC / month	$1,800 \div 200 = \mathbf{9}$	~2 orders/week per active contractor
Fixxly penetration of catchment	$200 \div 5,000 \approx \mathbf{4\%}$	Mid catchment $\div$ mid MAC — early stage, credible

Identity check: $\text{MAC} \times \text{orders/MAC} = \text{monthly orders} \rightarrow \mathbf{200 \times 9 = 1,800} \checkmark (= 60 \text{ OPD} \times 30)$

2. Diagnosis — why 40% do not reorder

Not all non-repeat is churn. Three buckets:

Five reasons — ranked by conviction

Rank	Reason	Conviction	Summary
1	Next run goes to hardware dealer	High	Order 1 = urgent trial on Fixxly. Order 2 = new list → dealer wins on WhatsApp, credit, spec, one message.
2	14-day metric mixes job types	Medium	Daily-site contractors appear churned at D14 even when still active. Segment before reacting.
3	App is a shop, not job workflow	High	No client hisaab at job start. Dealer owns "material kitna lagega?"
4	Next basket not stocked / findable	Medium	Silent search exit — looks like disinterest; is assortment gap.
5	Tail: bad delivery, noise, no need	Low	Real but requires OTIF + cohort data. Not the primary lever.

Primary addressable gap: #1 + #3 — dealer habit at **job start**, not checkout.

Lower priority at launch: Discount coupons, "reorder last order" as hero, or renovation-only phase kits for a daily-job base.

Today vs tomorrow — where Fixxly loses

3. Product response — Bill Banayein

One-line summary

Contractor creates a client material bill in 3 minutes — voice or template — sees Fixxly vs dealer split, adds markup, shares PDF. Customer never sees Fixxly.

What changes for the contractor

Today	With Bill Banayein
Search SKUs one by one	Speak or pick job template
Fixxly = partial catalogue	Full job bill with honest split
Client quote = dealer responsibility	Contractor-branded PDF
Order 2 = forgotten app	Every new job starts in Fixxly

End-to-end flow

Who sees what

Audience	Sees	Never sees
Client	Contractor PDF, sell prices	Fixxly, cost, dealer split
Contractor	Full bill, margin ₹, Fixxly/dealer tags	—
Dealer (WhatsApp)	Site, spec, qty	Prices

4. What the AI does (and does not do)

Not a chatbot. AI orchestrates **bill assembly** → **pricing** → **split** → **PDF**.

Data required

Data	Use	At launch
Order history	Templates, frequent lines	✓
Fixxly SKU + inventory	Split + one-click order	✓
Contractor profile	PDF letterhead, language, markup default	✓
Reference master (extended)	Price lines Fixxly does not stock	✓ pilot
Site list	Reuse delivery addresses	Nice-to-have

Model approach — hybrid

Step	Approach	Rationale
Voice → lines	Streaming STT + constrained NLU	Live bill; Kannada + English
Job → template	Rules	Auditable BOM seeds
Line → SKU	Retrieval	No hallucinated products
Reference price	Crawl + median + rules	Tag estimate ; contractor confirms
Fixxly split	Hard inventory rule	Trust — OOS never shown as Fixxly
Client PDF	Templates	Cheap, consistent, white-label
Markup	Rules + UI	Business-critical; not LLM

Why not pure LLM: Wrong SKU or price → contractor loses credibility with client.

Why not pure rules: Trade speech is messy; voice requires NLU.

5. Success at 30 days (1-store pilot)

Metric	Target	Rationale
Bills / active contractor / week	≥ 1.5	Proves job-start habit (vs ~0.3 browse-only)
Bill → Fixxly order (7d)	≥ 45%	Revenue, not PDF alone
Bill → client share	≥ 50%	Proves real client workflow
Orders / contractor / week	+30% vs holdout	Moves OPD toward 150
Baseline orders / MAC / month	~9 today	60 OPD × 30 ÷ ~200 MAC (Appendix A)
Time to shareable PDF	< 5 min median	On-site usable at 7:45 AM
Pricing disputes	< 8%	Trust gate

Rollout: W1 template + split + PDF · W2 voice + live bill · W3 reference pricing · W4 metrics.

6. UX — three screens (assignment cap)

Persona: Raju Kumar, plumber, 10th pass, on-site 7:45 AM, dusty hands, Kannada + English.

Principles: One primary action per screen · voice before typing · numbers over paragraphs · client never sees Fixxly.

Entry (not counted): Home → **Bill Banayein** tile — *"Client estimate in 3 minutes — just speak it"*

Screen journey

SCREEN 1	SCREEN 2	SCREEN 3
Bol ke banao	Hisaab + split	Client ko bhejo
Voice + live bill	Fixxly Dealer	PDF preview
Template fallback	Stock + estimate	Contractor brand
	30 min delivery	Share → order

High-fidelity mocks below. Full flow has 8 steps; these three meet the assignment cap.

Screen 1 — Bol ke banao (*Speak and build*)

Purpose: Start the bill without searching the catalogue.

Key elements:

- Contractor speaks in Hindi/English mix — "Hindware ka wash basin... ek piece"
- **Bill so far** updates live (4 lines) while recording — instant feedback at 7:45 AM
- Fixxly lines (F) vs dealer lines (D) tagged early; wash basin marked **(estimate)**

Screen 2 — Hisaab + split (*Fixxly vs dealer*)

Purpose: Trust the numbers; see exactly what Fixxly can deliver in 30 min.

Key elements:

- **Fixxly se** — 4 lines · exact prices · in-stock counts · 30 min delivery
- **Dealer se** — remaining lines · reference **estimate** (e.g. ₹19,800 for 4 lines)
- Honest split — no pretence that the dark store stocks everything

Next in flow: markup (mandatory) → client preview.

Screen 3 — Client ko bhejo (*Share under contractor brand*)

Purpose: Share a professional estimate with the client — **no Fixxly branding**.

Key elements:

- **Raju Kumar, Plumber** letterhead only — green banner: *No Fixxly logo*
- Client sees **sell prices** and **TOTAL ESTIMATE** — not cost, not dealer split
- Branded estimate ID (ESTIMATE RK/26/0247) — contractor presents professionally on site

After this screen: Share PDF on WhatsApp → one-tap Order Fixxly parts → dealer list (no rates).

7. Week 1 validation plan

Question	Method
Where did order 2 materials come from?	15 contractor interviews
Opened app but did not order vs never reopened?	Funnel / event data
When does client hear material number?	Shadow 10 jobs on site
D14 vs D21/D30 by job type?	Cohort segmentation
Search → zero result → exit?	Search log analysis

8. Risks and mitigations

Risk	Mitigation
Dealer still receives full shopping list	Accept at launch; order Fixxly first in UX; tackle credit later
Wrong reference price	Estimate label + contractor confirmation before share
Voice fails on noisy site	Template always visible; every line editable
Customer sees Fixxly	White-label PDF only; QA checklist

Conclusion

Bill Banayein puts Fixxly at the start of every job — full client hisaab, honest Fixxly vs dealer split, contractor keeps the margin — so order 2 is natural, not a forgotten reorder button.

Part 3 — Business Case: Bill Banayein

Pankaj Khannade · Fixxly Head of Product Assignment
May 2026

Recommendation

Prioritize Bill Banayein for the next 90 days.

Fixxly already wins **order 1**. It loses **order 2 and beyond** because the **hardware dealer** still owns the client material list. Bill Banayein places Fixxly at **job start** (hisaab → order), which increases **frequency and retention** among existing contractors — the fastest lever to move from **60 to 150 OPD per store** without a catalogue war or paid-acquisition blitz.

All figures use the assumptions stated below. Update MAC, CAC, and contribution with Fixxly actuals.

The numbers

Metric	Current	With Bill Banayein (90 days)
Week-2 retention %	60%	74%
Orders / contractor / month	9	15
Monthly GMV / store (₹)	₹36 lakh	₹90 lakh
CAC payback period	~0.7 months	~0.4 months

Verification: 300 active contractors × 15 orders = 4,500 orders/month = 150 OPD. At ₹2,000 AOV, that is ₹90 lakh GMV per store.

Path to 150 OPD

One store, 90 days. Three product-led moves — not increased paid traffic.

Step	What changes	OPD / day
Today	200 contractors × 9 orders/month	60
+ Bill habit	Same contractors order more often (9 → 12/month)	80
+ Retention	More contractors stay active (200 → 280 MAC)	112
+ Deeper habit	280 → 300 MAC; 12 → 15 orders/month	150

Bill Banayein directly drives **frequency** (steps 1→2) and **retention** (2→3). Step 4 is the 90-day operating target.

Assumptions

Input	Current	Day 90	Note
OPD / store	60	150	Stated target
Active contractors / store (MAC)	~200	~300	60 OPD, ~1.3 orders/active day, overlap ≈ 200 unique/month
Orders / contractor / month	9	15	$1,800 \div 200 \rightarrow 4,500 \div 300$
AOV	₹2,000	₹2,000	Mid urgent basket
Contribution / order	₹180 (~9%)	Same	After pick + delivery
Blended CAC (1st order)	₹1,100	Same	Field-heavy; range ₹900–1,400
Week-2 retention	60%	74%	65% on Bill @ ~82% D14; remainder ~55% D14
Bill Banayein adoption	—	~65% of MAC	Rollout target

CAC: ~₹20k/month field promoter $\div$ ~15 first-order activations + ~₹150 promo $\approx$ **₹1,350 per field activation**; blended with organic/referral $\rightarrow$ **~₹1,100**.

Payback: $\text{CAC} \div (\text{orders/month} \times \text{contribution}) \rightarrow ₹1,100 \div (9 \times ₹180) = \mathbf{0.7 \text{ mo}}$ · $₹1,100 \div (15 \times ₹180) = \mathbf{0.4 \text{ mo}}$.

Why Bill Banayein before anything else

1. Fixxly's 40% non-repeat problem is **structural** — order 2 and beyond goes to the **hardware dealer** because the app never owned **client material hisaab** — and Bill Banayein intercepts that moment **before** the dealer receives the WhatsApp list.

2. It raises **orders per contractor** (9 $\rightarrow$ 15) and **retention** among the **~200 contractors already in each store's catchment** — without waiting for 3x SKU count or a catalogue war with HomeRun.

3. At **~₹1,100 CAC** and **₹180/order contribution**, that frequency lift improves payback from **~0.7 to ~0.4 months** and GMV per store from **₹36L to ₹90L** — the fastest credible path to **150 OPD in 90 days** because it attacks **habit**, not acquisition spend.

Secondary priorities

- **Coupons / cashback** — buys a repeat click; does not own the job workflow
 - **“Reorder last basket”** — wrong for contractors on a **new site every day**
 - **Catalogue expansion vs HomeRun** — Fixxly’s wedge is **30 min + workflow**, not SKU count
-

Risks and mitigations

Risk	Mitigation
Bill → Fixxly order conversion below 45%	Template path + Fixxly-first split UX; measure in 30-day pilot
Real MAC ≠ ~200	Track daily unique orderers; update bridge with actuals
Scale paid ads before retention works	Stay field-first at 60 OPD; cap paid mix

30-day pilot success criteria: Bill → order **≥45%** · D14 retention (bill users) **≥80%** · Orders/MAC **+30%** vs holdout.
